
PROFILE

- I have spent 17 years building healthcare software in the cardiometabolic space — Type-2 diabetes, smoking cessation, and GLP-1 weight management programs, including the CDC-certified diabetes-prevention software Rally Health operated across 22 states for Optum, Kaiser, and United Healthcare. I ran the engineering for that \$150M business unit through its acquisition by Optum/UHG.
- I have shipped AI/ML in production at regulated healthcare scale-ups. At First Opinion (acquired by CurAI) I ran the NLP/ML team directly and shipped the production triage, intent-classification, and severity-prediction stack; at Felt Clinic I am building LLM- and agent-driven clinical workflows. Happy to own the data, model, and serving layers myself before building a team around them.
- I have done the zero-to-one work three times — Felt Clinic (technical co-founder), Steady Health (founding engineer, acquired by Carbon Health), and the AI team at First Opinion. I set architecture from scratch, hire the first engineers, and work directly with founders, clinicians, and payer/provider partners under HIPAA, SOC 2, and FDA-aware controls.
- I manage managers and functional department heads, and I stay hands-on. The Rally organization peaked at 40+ engineers across the US, India, and Europe with engineering, QA, and DevOps each reporting up through their own managers; I spent six years there developing those managers, running OKRs and capacity planning, and holding teams to outcomes rather than output. I still write code, review PRs, take on-call, and join customer and investor conversations.

WHERE I'VE BEEN

Technical Co-Founder

July 2023 - Present

Felt Clinic, Inc.

San Francisco, CA

- Lead the technical organization—engineering, AI/ML, and a product manager reporting in directly—and own architecture, AI/ML roadmap, and engineering strategy for the healthcare SDK platform deployed across enterprise partners.
- Building frontier models on wearable signals—heart rate, sleep, activity, continuous glucose—to power narrative AI and medical-triage workflows for chronic-disease care.
- Architected service-oriented microservices on AWS with event-driven pipelines for high-throughput clinical data, lab integrations, and patient-level outcome tracking.
- Established Quality Management System-aligned compliance for data collection, consent flows, access controls, and audit logging (HIPAA, SOC 2; FDA-aware design controls).

Director of Engineering

May 2017 - July 2023

Rally Health (*acquired by Optum/UHG*)

San Francisco, CA

- Launched the GLP-1 medication-assisted weight management, Type-2 diabetes prevention, and smoking cessation programs that became Rally's flagship cardiometabolic offering. Built the payer/provider integration model serving Optum, Kaiser, and United Healthcare that drove member engagement and outcomes economics.
- Built and ran the engineering organization end-to-end: 40+ engineers across the US, Asia, and Europe, organized into product engineering, QA, and DevOps verticals with their own managers reporting in. Hired and developed those managers, set up performance and career-development frameworks, and partnered with product and clinical leadership cross-functionally.
- Designed cloud-native architecture on Kubernetes with Kafka event-driven pipelines, achieving high availability across the 22-state deployment. Drove modernization from legacy Jenkins to 100% CI/CD adoption and 50% cycle-time improvement.
- Shipped React and React Native consumer experiences at population-health scale, with a 24/7 on-call rotation, reduced operational toil, and disciplined post-incident learning loops. Partnered closely with VP of Product, clinical leadership, and business stakeholders on roadmap and data-driven decision-making.

Founding Engineer

Aug 2017 - Oct 2019

Steady Health, Inc. (*acquired by Carbon Health*)

San Francisco, CA

- Built a vertically-integrated Type-1 diabetes care platform zero-to-one—proof-of-concept through production launch and acquisition—bridging continuous glucose monitoring, endocrinology workflows, and patient self-management.
- Designed and built core platform APIs, service-oriented architecture, and event-driven pipelines for patient management, health records, billing, and continuous-glucose-monitor / lab-device integrations (Dexcom CGM, Abbott, Apple HealthKit, Google Fit).

- Hired and mentored the founding engineering team. Established engineering culture, development practices, quality standards, and deployment protocols from scratch under HIPAA constraints.
- Shipped React Native mobile (iOS/Android) and React clinical dashboard giving endocrinology teams real-time patient visibility—consumer-grade UX in a regulated chronic-disease environment.

AI Lead Engineer

Dec 2015 - May 2017

First Opinion, Inc. (*acquired by CurAI Inc.*)

San Francisco, CA

- Ran the NLP/ML and data-science team for an early-stage telemedicine product as a standalone function reporting into the founders. Built end-to-end AI chat solution that materially improved medical-staff efficiency and turnaround time on patient consults.
- Trained semi-supervised models over labeled patient-chat conversations and doctors' notes: dialogue acts, intent tagging, medical-severity prediction, predicted abuse, and premium-upgrade propensity (XGBoost, Keras, Scikit-Learn, NLTK).
- Developed efficient LSA-based word vectorizer + dimensionality reduction + clustering pipeline applied to medical-severity prediction; integrated into production to triage and prioritize incoming feeds.
- Shipped auto-summarization that captured key phrases from chat logs into structured interaction summaries for clinical staff.

Lead Engineer

Jan 2009 - Dec 2015

Cisco Systems, Inc. Wireless Networks, Advanced Solutions

San Jose, CA

- Built Cisco's Cloud Router and cloud management platform aggregating edge devices with real-time data capture and event-driven processing for high-throughput IoT sensor streams.
- Designed scalable multi-tenant data warehousing architecture with service-oriented design patterns and complex distributed system dependencies.
- Developed RFC-accurate TLS packet library and security infrastructure for the routing portfolio.

MY SKILLS

- Cardiometabolic & population health — Type-1/Type-2 diabetes, GLP-1 weight management, smoking cessation, CDC-certified DPP, payer/provider integration, member-engagement outcomes
- AI & ML — production model serving in regulated environments; NLP, intent classification, severity prediction, clustering; LLMs, agent patterns, and RAG; XGBoost, Keras, Scikit-Learn, NLTK
- Healthcare platforms — HIPAA, SOC 2, FDA-aware QMS, FHIR / HL7 clinical data exchange, Dexcom CGM, HealthKit / Google Fit, MedPlum and Healthie EMRs
- Architecture & infra — Python, Node.js, Java, microservices, event-driven pipelines (Kafka), AWS, Kubernetes, React / React Native, iOS/Android
- Leadership — OKRs and quarterly planning, capacity modeling, performance management, career-development frameworks, organizational design; scaled Rally engineering from a handful to 40+ across the US, India, and Europe
- Fundraising & investor meetings — preparing pitch material, technical due diligence, and product roadmap conversations with VCs and strategic investors at Felt Clinic

SELECTED RECOGNITION

- Three healthcare acquisitions: Rally Health by Optum/UHG, Steady Health by Carbon Health, and First Opinion by CurAI.
- Operated Rally Health's \$150M digital business unit (grew EBITDA to \$50M) and shipped its flagship cardiometabolic offerings: the CDC-certified Diabetes Prevention Program across 22 states and the GLP-1 weight-management programs.
- Presented Cisco's Cloud Router architecture at Cisco Live, Mobile World Congress Europe, and Interop NY; helped Cisco regain Gartner's Leaders quadrant via the Akamai partnership.

WHERE I AM GOING

- I want to build the technical organization for a cardiometabolic health-AI company shipping clinically meaningful AI into population-health workflows — wearable signals, EMR and pharmacy data, and clinician-in-the-loop agents combining to move outcomes on GLP-1, diabetes, and weight management. That means owning the full data path from device through model through clinical decision, running engineering and data science as peer functions, and baking regulated-environment compliance in from day one. I want operators who have founded healthcare companies before and partner/payer/provider access close enough that the team is never building in a vacuum.
